## Assignment for the course *The statistical analysis of time series*

Antonio, Elena Proden, Hervégil Voegeli January 8, 2021

## 1 Theoretical aspects

[1.]

[ 1.1 ] Compute the autocovariance function  $\gamma_X(k) = \text{cov}(X_t, X_{t+k})$  for k = 0, 1, ... Is  $\chi$  stationary? Do we need a restriction on  $\theta$ ?

$$\begin{split} \gamma_X(k) &= \text{cov}(X_t, X_{t+k}) \\ &= \text{E}((W_t + \frac{1}{\theta}W_{t-1})(W_{t+k} + \frac{1}{\theta}W_{t+k-1})) - \text{E}(W_t + \frac{1}{\theta}W_{t-1})\text{E}(W_{t+k} + \frac{1}{\theta}W_{t+k-1}) \\ &= \text{E}((W_t + \frac{1}{\theta}W_{t-1})(W_{t+k} + \frac{1}{\theta}W_{t+k-1})) \\ &= \text{E}(W_t W_{t+k} + \frac{1}{\theta}W_t W_{t+k-1} + \frac{1}{\theta}W_{t-1} W_{t+k} + \frac{1}{\theta^2}W_{t-1} W_{t+k-1}) \\ &= \begin{cases} \sigma_W^2(1 + \frac{1}{\theta^2}) & h = 0 \\ \frac{\sigma_W^2}{\theta} & |h| = 1 \\ 0 & \text{else} \end{cases} \end{split}$$

 $\Rightarrow$   $X_t$  is weakly stationary.

Apart from  $\theta \neq 0$ , to avoid  $1 + |\frac{1}{\theta}| \to \infty$ , no conditions for  $\frac{1}{\theta}$  necessary to get stationarity on MA(q) processes.

[ 1.2 ] Use the definition of Fourier transform of  $\gamma_X$  and derive the expression of the spectral density,  $f_X(\lambda)$ ,  $\lambda \in [-1/2, 1/2]$ .

$$\begin{split} f_X(\lambda) &= \sum_{k=-\infty}^{\infty} \gamma_X(k) \exp(-2\pi i \lambda k) \\ &= \sum_{k=-2}^{-\infty} \gamma_X(k) \exp(-2\pi i \lambda k) + \gamma_X(-1) \exp(-2\pi i \lambda \cdot (-1)) \\ &+ \gamma_X(0) \exp(-2\pi i \lambda \cdot 0) + \gamma_X(1) \exp(-2\pi i \lambda \cdot 1) + \sum_{k=2}^{\infty} \gamma_X(k) \exp(-2\pi i \lambda k) \\ &= \sigma_W^2 \left( \frac{\theta(\exp(2\pi i \lambda) + \exp(-2\pi i \lambda)) + \theta^2 + 1}{\theta^2} \right) \\ &= \sigma_W^2 \left( \frac{\theta(\cos(2\pi \lambda) + i \sin(2\pi \lambda) + \cos(2\pi \lambda) - i \sin(2\pi \lambda)) + \theta^2 + 1}{\theta^2} \right) \\ &= \frac{\sigma_W^2}{\theta^2} (2\theta \cos(2\pi \lambda) + \theta^2 + 1) \end{split}$$

[2.]

[2.1] Compute the autocovariance function  $\lambda_Y(k) = \text{cov}(Y_t, Y_{t+k})$  for

$$k = 0, 1, \dots$$

$$\begin{split} \gamma_Y(k) &= \text{cov}(Y_t, Y_{t+k}) \\ &= \text{E}((\frac{1}{3}W_{t-1} + \frac{1}{3}W_t + \frac{1}{3}W_{t+1})((\frac{1}{3}W_{t+k-1} + \frac{1}{3}W_{t+k} + \frac{1}{3}W_{t+k+1}))) \\ &= \begin{cases} \frac{\sigma_W^2}{3} & h = 0 \\ \frac{2\sigma_W^2}{9} & |h| = 1 \\ \frac{\sigma_W^2}{9} & |h| = 2 \\ 0 & \text{else} \end{cases} \end{split}$$

[ 2.2 ] Use the definition of Fourier transform  $\lambda_Y$  and derive the expression of the spectral density  $f_Y(\lambda)$ ,  $\lambda \in [-1/2, 1/2]$ 

$$\begin{split} f_Y(\lambda) &= \sum_{k=-\infty}^\infty \gamma_Y(k) \mathrm{exp}(-2\pi i \lambda k) \\ &= \gamma_Y(-2) \mathrm{exp}(4\pi i \lambda) + \gamma_Y(-1) \mathrm{exp}(2\pi i \lambda) + \gamma_Y(0) \\ &= +\gamma_Y(1) \mathrm{exp}(\pi i \lambda) + \gamma_Y(2) \mathrm{exp}(-4\pi i \lambda) \\ &= \sigma_W^2 \left( \frac{\mathrm{exp}(4\pi i \lambda) + \mathrm{exp}(-4\pi i \lambda) + 2 \mathrm{exp}(2\pi i \lambda) + 2 \mathrm{exp}(-2\pi i \lambda) + 3}{9} \right) \\ &= \sigma_W^2 \left( \frac{2 \mathrm{cos}(4\pi \lambda) + 4 \mathrm{cos}(2\pi \lambda) + 3}{9} \right) \end{split}$$

[3.]

[ 3.1 ] Derive the expression for joint autocovariance function  $\lambda_{WY}(k) = \text{cov}(W_{t+k}, Y_t)$ .

$$\begin{split} \gamma_{WY}(k) &= \text{cov}(W_{t+k}, Y_t) \\ &= \text{E}(W_{t+k}(\frac{1}{3}(W_{t-1} + W_t + W_{t+1}))) \\ &= \frac{1}{3}\text{E}(W_{t+k}W_{t-1} + W_{t+k}W_t + W_{t+k}W_{t+1}) \\ &= \left\{ \begin{array}{ll} \frac{\sigma_W^2}{3} & h = 0 \text{ or } |h| = 1 \\ 0 & \text{else} \end{array} \right. \end{split}$$

[ 3.2 ] Derive the expression of the cross-spectrum

$$\begin{split} f_{WY}(\lambda) &= \sum_{k=-\infty}^{\infty} \gamma_{WY}(k) \exp(-2\pi i \lambda k) \\ &= \gamma_{WY}(-1) \exp(2\pi i \lambda) + \gamma_{WY}(0) \\ &= +\gamma_{WY}(1) \exp(\pi i \lambda) \\ &= \sigma_W^2 \left( \frac{\exp(2\pi i \lambda) + \exp(-2\pi i \lambda) + 1}{3} \right) \\ &= \sigma_W^2 \left( \frac{\cos(2\pi \lambda) + i \sin(2\pi \lambda) + \cos(-2\pi \lambda) + i \sin(-2\pi \lambda) + 1}{3} \right) \\ &= \sigma_W^2 \left( \frac{2\cos(2\pi \lambda) + 1}{3} \right) \end{split}$$

[ 3.3 ] Let  $f_W$  be the spectral density of the white noise process. Making use of the result in point 3.2, rearrange the terms and express  $f_{WY}(\lambda)$  and provide the form of the term  $|A_{WY}(\lambda)|^2$ 

$$f_W(\lambda) = \sum_{k=-\infty}^{\infty} \gamma_W(k) \exp(-2\pi i \lambda k) = \gamma_W(0) = \sigma_W^2$$

$$f_{WY}(\lambda) = \sigma_W^2 \left( \sum_{k=-1}^{1} \left( \frac{1}{\sqrt{3}} \exp(2\pi i \lambda) \right)^2 \right)$$

$$= \sigma_W^2 |A_{WY}(\lambda)|^2$$

$$|A_{WY}(\lambda)|^2 = \left( \sum_{k=-1}^{1} \left( \frac{1}{\sqrt{3}} \exp(2\pi i \lambda) \right)^2 \right)$$

- [4.] Prove that  $f_S(\lambda) = |A_{SQ}(\lambda)|^2 f_Q(\lambda)$  with  $A_{SQ}(\lambda) = \sum_{j=-\infty}^{\infty} a_j \exp(-2\pi i \lambda j)$ 
  - [4.1] Show that

$$\begin{split} \gamma_S(k) &= \text{cov}(S_{t+k}, S_t) \\ &= \text{E}(\sum_{j=-\infty}^{\infty} a_j Q_{t+k-j} \cdot \sum_{j=-\infty}^{\infty} a_j Q_{t-j}) \\ &= \text{E}\left((...a_-1Q_{t+k+1} + a_0 Q_{t+k} + a_1 Q_{t+k-1}...\right) \\ &\cdot (...a_-1Q_{t+1} + a_0 Q_t + a_1 Q_{t-1}...) \ ) \\ &= ...\text{E}(a_-1Q_{t+k+1}a_-1Q_{t+1}) + \text{E}(a_-1Q_{t+k+1}a_0 Q_t) \\ &+ \text{E}(a_-1Q_{t+k+1}a_1 Q_t - 1)... \\ &= \text{E}(\sum_r \sum_s a_s Q_{t+k-r} a_r Q_{t-s}) = \text{E}(\sum_r \sum_s a_r a_s Q_{t+k-r} Q_{t-s}) \\ &= \sum_r \sum_s a_r a_s \text{E}(Q_{t+k-r} Q_{t-s}) = \sum_r \sum_s a_r a_s \gamma_Q(k-r+s) \\ &= \sum_r \sum_s a_r a_s \left( \int_{-1/2}^{1/2} \exp(2\pi i \lambda (k-r+s)) f_Q(\lambda) \mathrm{d}\lambda \right) \end{split}$$

## [4.2] Prove that

$$|A_SQ(\lambda)|^2 = |\sum_{j=-\infty}^{\infty} a_j \exp(-2\pi i \lambda j)|^2$$

$$= \sum_r \sum_s a_r a_s \exp(-2\pi i \lambda r) \exp(2\pi i \lambda s)$$

$$= \sum_r a_r \exp(-2\pi i \lambda r) \sum_s a_s \exp(2\pi i \lambda s)$$

$$\gamma_S(k) = \sum_r \sum_s a_r a_s \left(\int_{-1/2}^{1/2} \exp(2\pi i \lambda (k - r + s)) f_Q(\lambda)\right)$$

$$= \sum_r \sum_s a_r a_s \left(\int_{-1/2}^{1/2} \exp(2\pi i \lambda k) \exp(-2\pi i \lambda r) \exp(2\pi i \lambda s) f_Q(\lambda)\right)$$

$$= \int_{-1/2}^{1/2} \sum_r a_r \exp(-2\pi i \lambda r) \sum_s a_s \exp(2\pi i \lambda s) \exp(2\pi i \lambda k) f_Q(\lambda)$$

$$= \int_{-1/2}^{1/2} |A_SQ(\lambda)|^2 \exp(2\pi i \lambda k) f_Q(\lambda)$$

By definition 
$$\gamma_S(k) = \int_{-1/2}^{1/2} \exp(2\pi i \lambda k) f_S(\lambda) d\lambda$$
  
Then  $\int_{-1/2}^{1/2} \exp(2\pi i \lambda k) f_S(\lambda) d\lambda = \int_{-1/2}^{1/2} |A_S Q(\lambda)|^2 \exp(2\pi i \lambda k) f_Q(\lambda)$   
 $f_S(\lambda) = |A_S Q(\lambda)|^2 \frac{\exp(2\pi \lambda k)}{\exp(2\pi \lambda k)} f_Q(\lambda)$   
 $|A_S Q(\lambda)|^2 f_Q(\lambda)$ 

## 2 Numerical exercises

Please see *Assignment\_TS.rmd* for the analysis (code and comments).
